

TELESCOPIC DOUBLE SLIDING DOOR

The double telescopic sliding door can be built with our mesh and polycarbonate panels to fit your chosen machine guard system. Use the standard panel height 2,050 mm or 1,250 mm in up to 6 widths. You can also combine the standard panels or order special width panels to create the required door blade size.

The sliding doors are supplied with posts, panels, and door kit for assembly on site.

Two telescopic rails, one at the top and one at the bottom of each door blade increases the stability. As there is no rail at the top or bottom of the door, you get a door opening with clear access in height.

Depending on the risk assessment, you choose the preferred lock for your door; Euro cylinder, Safe Lock, or any other type of handle solution with or without a safety switch included.

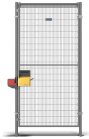

The standard opening width is approximately 1,600 - 3,000 mm.
