

# SAFE ESCAPE LOCK

The Safe Escape Lock is the perfect lock for Automated Warehouses. It can be supplemented with a non-contact, proximity switch inside, making sure the power is cut off when the door is opened. The knob and euro cylinder lock ensures a locked door from the outside that only authorized staff with a key can enter. The red handle for panic escape can only be reached from the inside and is protected by a black plate from the outside to prevent tampering. The strong locking tube which is made of aluminium has a fixing for a padlock, this can be used to secure the door when open and prevent it from being closed during maintenance operations. Choose from a variety of switches to be fitted to your lock and our profile euro cylinder. The Safe Escape is supplied pre-mounted as a right or left version, to fit either the single hinged or the double hinged doors.
